scale

- Scale AI

 S2016

• Active • 500 employees • San Francisco, CA, USA

Scale accelerates the development of AI within organizations of any size to deliver critical business insights and operational efficiency. Its data-centric infrastructure platform leverages RLHF (Reinforced Learning with Human Feedback) to help organizations build the strongest AI models that supercharge their business, with customers across industries including Meta, Microsoft, U.S. Army, DoD's Defense Innovation Unit, Open AI, General Motors, Toyota Research Institute, Brex, Instacart and Flexport.

machine-learning

- Podium

 W2016

• Active • 1,000 employees • Lehi, UT, USA

Podium is the all-in-one AI-powered lead management and communication platform used by more than 100,000 businesses to acquire and convert new customers. At the forefront of Podium's innovation is its AI employee, who ensures businesses respond to leads instantly, anytime of the day or night—significantly increasing lead conversion rates and revenue. Podium helps businesses obtain more reviews, rank higher on Google, and consolidate lead channels. Businesses can call and text customers from the web and/or mobile app, send payment links, drive repeat business through bulk messages, and more—all managed and delivered from one easy-to-use dashboard. Additionally, with Podium's AI Employee and automations, businesses can efficiently handle customer inquiries seamlessly across all communication channels, providing timely and accurate responses that drive sales. Podium's innovative work has gained recognition on top industry lists, such as Forbes' Next Billion Dollar Startups, Forbes' Cloud 100, the Inc. 5000, and Fast Company's World's Most Innovative Companies. Podium was founded in 2014 and is headquartered in Lehi, Utah. It is currently backed by Accel, Summit Partners, GV (formerly Google Ventures), and Y Combinator.

[ai](#)

[trust-&-safety](#)

[Overshoot](#)

Y [W2026](#)

[• Active • 2 employees • San Francisco, CA, USA](#)

[Overshoot makes it easy for developers to build and run real-time vision applications. AI can see and understand the physical world. This unlocks new applications in physical security, safety, gaming, robotics and general consumer products. Soon, video agents will watch your home and your pet when you're away.](#)

However, existing platforms make it painful for developers to build these real-time applications. Slow inference. Limited model availability. Break at scale. Overshoot solves this. Today, 300+ developers connect live video feeds to the largest collection of Vision Language Models with 3 lines of code. And get responses in less than 200ms. 10x faster than any existing inference platform. Zero infra headache. Our moat is focus. Image and Video are fundamentally different modalities from text. By focusing on them, we are able to make strong technical leaps from codec, streaming protocols to inference engines. Younes and Zakaria are cousins. Zakaria graduated top of his class at LSE and MIT, and later built low-latency high-throughput pricing systems (surge) at Uber and inference engines at Meta. He previously built and sold a software product and won several prominent AI hackathons. Younes was a founding engineer at Cosmonio (later acquired by Intel). He built a training and serving Computer Vision platform from scratch. He witnessed firsthand customers abandoning traditional Computer Vision because it lacked the “general” intelligence LLMs have today. Together we’ve shipped large-scale systems and know where they break.

ai

• Emdash

 W2026

• Active • 2 employees • San Francisco, CA, USA

Agent-first development environment. Emdash enables engineering teams to develop software faster, by running multiple coding agents in parallel. We're an open-source and provider-agnostic desktop application.

artificial-intelligence

developer-tools

ai

open-source

• Origami Robotics

 W2026

• Active • 5 employees • Millbrae, CA, USA

We are building a "manipulate anything" model with the robot hardware that embodies it. We designed a hand-based data-collection device and a high DOF, direct drive robotic hand that match each other exactly, enabling us to eliminate embodiment gap and collect real-world data and deploy it directly. We want to scale real world manipulation data by deploying our devices "in the wild" like manufacturing factories, logistic centers to collect Tesla like data, use these data to train our model and then provide automation solutions to these industries.

Beacon Health

Y W2026

• Active • 2 employees • New York, NY, USA

Beacon Health (YC W26) is building AI agents for primary care - starting with value-based care. Primary care is the primary source of care for 200M Americans but physicians don't have the bandwidth to manage their patient panels - preventative screenings, prior authorizations, referrals, and risk adjustment, all important work that steals time from patients. Our AI agents handle workflows for them directly in their EHR. We own them from end to end - putting their value based care on autopilot. We're on a mission is to bring joy back to primary care.

health-tech

primary-care

ai

Robby

Y W2026

• Active • 3 employees • San Francisco, CA, USA

Robby is an AI growth engine for home services businesses that uncovers revenue opportunities and collects additional data from every technician visit. Our AI combines customer and third party data to generate dozens of new leads every day, and then arms the technicians with talking points to increase close rates, giving GMs a single command center to manage and drive revenue. We have several paying customers that are each uncovering 6 figures in additional revenue opportunities every week. On our first day of launch, we helped close \$40k in new business within an hour. Our team has spent the last few months riding along with dozens of technicians and shadowing every position in the office to best understand the industry. We're also studying for the EPA 608 exam to become certified technicians ourselves. Vineet and Feroze have both built critical products and infra at prominent startups (Ironclad, Porter, Affinity, Uber, Cloud Health Systems). Joe previously consulted PE firms on software acquisitions and led home services growth projects at Bain. We all met at Harvard Business School, and dropped out to work on Robby full-time.

[Unisson](#)

YW2026

• Active • 2 employees • San Francisco, CA, USA

[Unisson is building trusted AI subject-matter experts for teams that are responsible for customer deployments \(technical customer success, implementation, sales engineering\). Within 20 minutes, our agents learn to use any product and can be used by teams in Slack, text, or email. Our agents gather requirements and context from existing tools enabling them to handle complex tasks like customer health audits, onboarding, product administration, and custom integrations. With Unisson, customer-facing teams have 24/7 access to an AI SME, allowing them to scale and save thousands of hours every month.](#)
[workflow-automation](#)
[enterprise-software](#)
[ai](#)

[Salus](#)

YW2026

• Active • 2 employees • San Francisco, CA, USA

[Your agent processed a refund without looking up the order ID, costing you thousands. You only found out three hours later from a support ticket. Evals, output scoring, and observability can reduce the likelihood of mistakes like these occurring - but there's no solution that inspects and prevents an action as it's about to execute. Salus does that. We've built an API that wraps around your agent and checks its actions at run time, blocking incorrect ones and providing immediate feedback to guide retries. Kevin and Vedant were roommates at Stanford, where they both studied computer science.](#)

[recruiting](#)

[b2b](#)

[artificial-intelligence](#)

• [Samora AI](#)

 [W2026](#)

• [Active](#) • [8 employees](#) • [San Francisco, CA, USA](#)

Samora runs multilingual voice operations for organizations with high-volume calling without requiring engineering teams, call centers, or AI expertise. Many important tasks still depend on phone calls, including customer support, outreach, follow-ups, screening, and intake. But voice AI often fails in production because real callers interrupt, go off-script, switch languages mid-sentence, and speak in local dialects. Teams also worry about safety and compliance, especially when an agent can accidentally make the wrong promise. Samora solves this with voice agents that sound local and follow strict rules. Samora agents handle inbound and outbound calls, collect information, and update internal systems like CRMs, ticketing tools, and ATS platforms. When a call becomes sensitive or uncertain, the agent hands off to a human. It can also follow up over WhatsApp, SMS, or email when needed. With Samora, teams get: 1. Voice agents that work in real conversations, including dialects and code-switching 2. Strict safety controls so agents don't make unauthorized offers, discounts, or promises 3. Calls that result in completed actions, system updates, and safe human handoff

ai
b2b

Sentrial

Y W2026

• Active • 2 employees • San Francisco, CA, USA

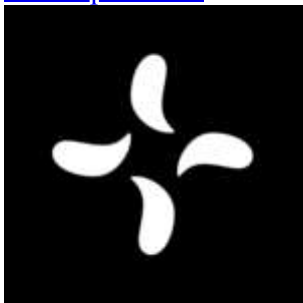

Sentrial is the observability platform for AI agents in production. When your agent loops indefinitely, hallucinates, or frustrates users, Sentrial detects it in real-time, diagnoses the root cause, and recommends specific fixes. We provide the monitoring, evaluation, and debugging infrastructure that traditional tools weren't built for, so teams can ship agents with confidence and iterate based on real production behavior, not just evals/benchmarks.

ai

aiops

developer-tools

Stilta

Y W2026

• Active • 4 employees • San Francisco, CA, USA

Stilta is the AI-native software for patent practitioners, built on agentic workflows to amplify how IP work is done end-to-end. Instead of spending weeks manually researching and analyzing patents, practitioners can reduce manual work by up to ~60% while unlocking new revenue opportunities. Innovation is key to solving the world's most important challenges, but the tools to protect innovation haven't kept up. Patent teams are stuck doing high-stakes work with a process built around manual document review and disconnected point solutions. Existing tools are rigid and fail by not integrating AI with clear traceability.

(every output must be source-backed, referenced, and auditable). General LLM solutions generate text, but they don't solve trust and integration in legal-grade workflows. We're four engineers from McKinsey/QuantumBlack who've spent the last few years building and deploying AI for large organizations. Now we are building Stilta because the practitioners protecting the world's most valuable ideas deserve tools that match the stakes. We're already live with leading firms in both Europe and the US.

legaltech

• VOYGR

YW2026

• Active

VOYGR helps AI apps and agents understand and act in the real world with comprehensive place data. Unlike static mapping APIs, VOYGR combines accurate place intelligence with fresh web context – news, articles, and events. Real-world interactions rely on maps: 10M+ apps/websites, up to 40% of search queries, and 20% of LLM prompts need local context. Yet a restaurant recommendation can fail because the place is closed, menus aren't searchable, or delivery goes to the wrong entrance. AI pushes expectations further – answering semantic prompts like “specialty coffee shops in SF with Wi-Fi and YC founders”, and taking actions like making reservations or placing orders. We're experienced builders in maps, search, and ML to solve this. Vlad knows this space inside and out – he worked on the Google Maps APIs GTM, plus firsthand customer experience from building in ridesharing and travel. Yarik has spent over a decade leading ML/search teams at Apple, Google, and Meta. Several customers already run VOYGR to continuously validate places data accuracy at scale, and we outperform on accuracy and coverage. Maps were built for humans browsing pins; agents need continuously updated place ground truth they can act on – from copilots and in-car assistants to delivery robots and AR. As agents become the interface to commerce and services, VOYGR aims to be the default ground-truth layer.

[ai](#)
[fintech](#)
[saas](#)
[finops](#)

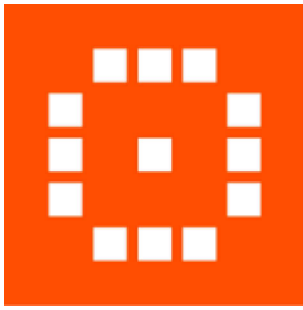

[Ruma Care](#)

 [W2026](#)

• Active • 2 employees • San Francisco, CA, USA

[Ruma Care automates prior authorizations - we're starting with clinics that administer the most expensive specialty medications. Biologics are expensive medications that cost \\$80-\\$150K+ per year per patient, and often need to be administered in specific settings called infusion clinics. Medical providers buy these drugs up front to secure pricing deals and safer inventory - they are reimbursed for the cost of the medications through the patients' insurance. Because they're so expensive, these specialty medications are denied by insurers at a rate of 37% each year. When they are denied, providers don't get reimbursed for the medication and are left covering the costs. Ruma Care solves this so clinics get paid, patients get treated faster, and care teams spend less time fighting insurance. We do this in three ways: 1. For each medication, diagnosis, and insurance combination, Ruma extracts the submission criteria required to get the drug approved by insurers. 2. We pull out the correct forms, then automate the form-filling for prior authorizations. 3. Lastly, we enroll patients in copay assistance programs, all in one workflow and platform. We turn a process that traditionally spans 70+ online portals, disparate paper forms, and manual phone calling into a single, streamlined platform. As we process prior authorizations, our models learn from denial patterns to understand exactly what insurers need to see to get a prior authorization approved.](#)

Scout Out

YW2026

• Active • 1 employees • San Francisco, CA, USA

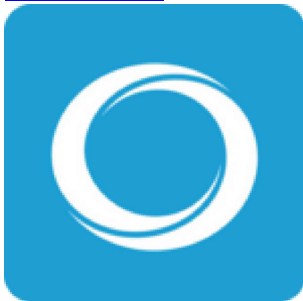

Scout Out helps residential contractors estimate jobs faster and submit clearer, more competitive proposals. Today, every contractor bidding a residential remodel or rebuild has to manually interpret plans, calculate material and labor quantities, and assemble a proposal from scratch. The process is slow, inconsistent, and expensive — and small differences in scope often decide who wins the job. ScoutOut automates this workflow. We use computer vision trained on residential building plans to generate structured material and labor takeoffs, which contractors can review, customize, price, and turn into professional proposals. Instead of starting from zero on every bid, contractors start with a standardized, high-quality estimate they can trust. The result: contractors bid faster, price more consistently, and submit clearer proposals — helping them win more residential remodeling and contracting jobs with less overhead. We're starting in Los Angeles, working closely with residential contractors on remodels and post-fire rebuilds following the Palisades and Eaton fires.

[Our mission at 10x Science is to enable biopharmaceutical development to keep pace with AI-powered drug discovery. Thanks to AI, the front end of drug discovery is flooding the pipeline with new drug candidates. However, current solutions for drug development are unable to resolve drug complexity and cannot keep up with modern demand. Our platform is the unlock for this bottleneck. By applying modern AI to the development stage, specifically to protein characterization and quality assessment, we provide an end-to-end solution to dramatically speed up and scale up the preparation of candidates for the clinic. Our team is composed of Stanford University researchers from a Nobel Laureate's lab with 18+ years of collective domain expertise, 47+ scientific publications, and a 2x YC Founder. We move at the highest velocity and are positioned to lead the next-generation of modern AI drug development.](#)

[Current multimodal models can see and hear. But they talk when they shouldn't. They can't tell if you're speaking to them or someone else. We are building an AI that knows when to stay silent, yet still understanding what's going on in your conversation, so it can best assist when you do need it in real time. Our first version, fern-0.1: provides real-time expert opinions on demand, instant task delegation, zero interruptions. All as fast as ChatGPT voice and Gemini live.](#)

[Bizzy AI](#)

 [S2025](#)

• [Active](#) • [San Francisco, CA, USA](#)

[Bizzy handles your calls, captures and qualifies leads, and books appointments directly into your CRM. It understands your services better than a receptionist would, routes and escalates calls, and syncs with your existing tools to incorporate complex workflows, all so your team can focus on servicing leads, not qualifying them.](#)
